

MODEL RACING TECHNOLOGY

**microprocessor
controlled
digital discharger**

for 6 cell 7.2V race packs

Your new DDX has been specially developed by MRT to give 6 cell race packs a smooth controlled low current discharge, to keep packs in top condition with maximum performance. Using a DDX helps maintain the power and run-time of packs, so make sure you always use your DDX after every run.

The DDX is a state-of-the-art device, it's simple to use and is fully protected against any possible incorrect connection. To use your DDX just connect it to a pack, the LED will flash red while the DDX is active controlling the discharge process. (if the LED does not light the DDX is connected incorrectly) When the discharge is complete the LED will light up green. The pack can then be stored safely in perfect condition.

BE CAREFUL WHEN DDX IS ACTIVE AS IT CAN GET VERY HOT!!
